Fuel Delivery app

(SRS)Software Requirement Specification

Project Domain/ Category:

Web Application

Introduction:

The aim of this project is to develop a fuel delivery system named as “Fuel Delivery App” that will contain different types of device application software. The available software will be either licensed or free. All software will be available with their according to their specific genre. For licensed software, user will must register him/herself on the website.

Functional Requirements:

1. Admin will maintain proper record of customer in database.
2. Admin will add the categories in the invention
3. Admin will manage the system.
4. Sign up for new fuel station.
5. Sign in for registered fuel station.
6. Sign up page for new user
7. Sign in page for normal user.
8. Registered users (customers) purchase fuel by using payment method (online payment, cash on delivery)

This app will allow the people to search for fuel by different fuel station.

Non-Functional Requirements:

- **Operating System:**

Software will be run on all operating systems like Android, windows XP, windows 10, windows 11 and others.

- **Usability:**

Usability of this application will be easy to use without any difficulty.

- **Maintainability:**

This application would build up in such a way that classification of errors and maintenance of mechanism become easy.

- **Flexibility:**

This application would be flexible so that it can easily accept all changes at low cost, time and experience.

- **Security:**

This application will be secure. No one can use this application without a registered username and password.

- **Reliability:**

This System will support 7 X 24 operations.

- **Performance:**

Through this application, the customer can place an order for his fuel instantly.

Both buyers and sellers will be benefited by using this application.

- **Access:**

This application will be accessible over the internet.

Project Development Constraints:

Any project has constraints and risks that must be addressed to ensure the project's ultimate success. Time, scope, and cost are the three primary constraints that project managers should be aware of. These are commonly referred to as the three constraints or the project management triangle. Each constraint is linked to the others; for example, increasing the scope of the project will almost certainly require more time and money, whereas shortening the project's timeline may save money but reduce the scope.

Project management's three constraints

Time constraint:

The time constraint refers to the project's completion schedule, which includes deadlines for each phase of the project as well as the date for the final deliverable's rollout.

Scope constraint:

A project's scope defines its specific goals, deliverables, features, and functions, as well as the tasks necessary to complete the project.

Cost constraint:

The project's cost, also known as the project's budget, includes all of the financial resources required to complete the project on time and within its predetermined scope. Keep in mind that cost includes not only the cost of materials, but also labor, vendors, quality control, and other factors.
