Fuel Delivery App

(Proposal)

Background:

Companies that operate a lot of vehicles, such as taxi and cab companies, intercity and long-distance bus service operators, trucking agencies, and so on, frequently encounter difficulties when it comes to refueling their vehicles. Having to drive all their vehicles to the fuel pump to have them filled frequently causes chaos and makes keeping accurate track of the amount of fuel consumed difficult.

This fuel delivery app is created with Flutter and consists of three entities: Admin, fuel Station, and User.

This app allows users to order petrol or diesel and have it delivered to their door. The User only needs to specify their location, the type of fuel they require, and the quantity required. Users can also pay online by using the app itself. When an order is confirmed, this system sends it to the fuel station.

This system is very useful for every vehicles owner by getting fuel without any problem and the owner of fuel station by selling fuel.

Problem statement:

When the people are needed to refuel their vehicles then they become stranded and are unable to locate a nearby fuel pump.

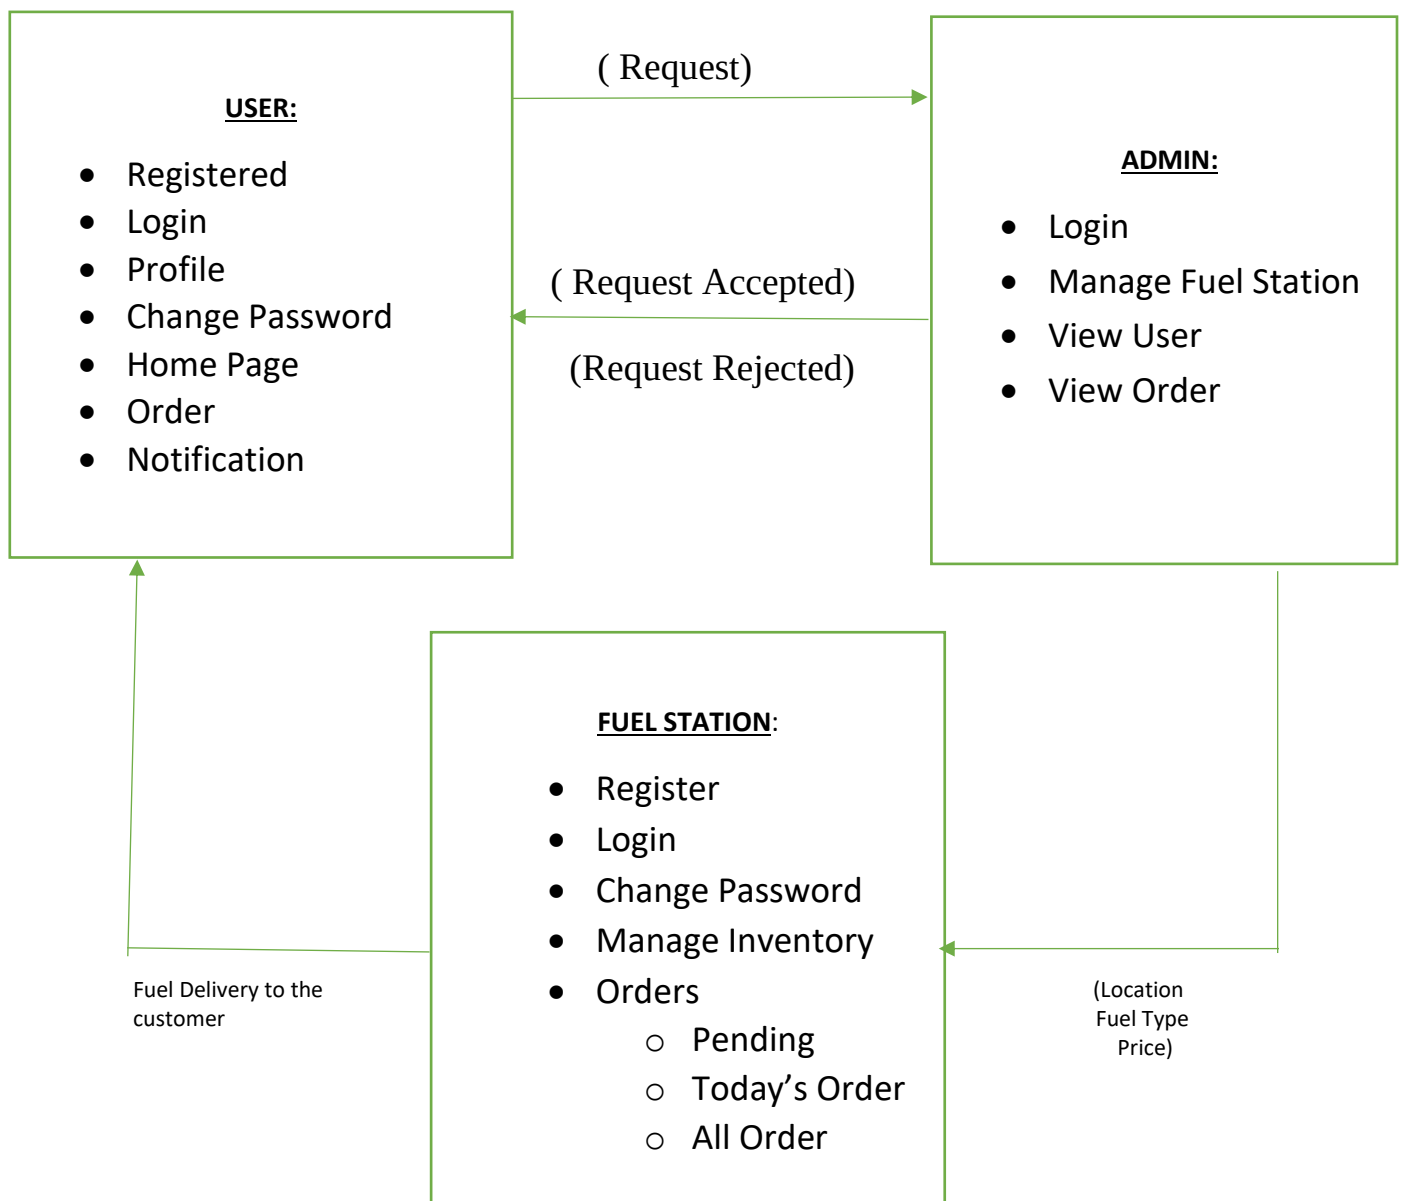

Project Objective:

- a. Fuel can be ordered online.
- b. The fuel station has no control over the price or type of fuel.
- c. Cancellation of the Order is permitted by both parties.
- d. Fuel stations are managed directly by the Admin.

Target user: Bike user, Truck user, car user, Bus user (which vehicle are driven by petrol and diesel).

Step by Step solution:

The User will be able to order fuel online using this system. The only User who can manage all of the fuel stations and monitor their orders is Admin. Fuel stations can view their orders and process them as needed. Fuel and fuel prices are assigned to each fuel station by the administrator. As a result, fuel Stations are unable to manipulate anything. However, fuel stations are permitted to cancel any order if they run out of fuel. Fuel stations can only update their inventory.

Basic Functionality:

In Bangladesh a lot of vehicle moves regularly. The main requirement of vehicle is fuel. Sometimes the fuel of vehicle is finished on the road. They can't move their vehicle. That's why they can't go to fuel station by running vehicle. If they want to go to fuel station the must push the vehicle or toe with another vehicle. Many time the fuel station is not near by the spot. It is an emergency situation. So, this software will solve this problem by online. If the customer request it will go to the admin. Then the admin transfers this order to the nearest Fuel station. Then the fuel station send fuel by a delivery boy.

The system comprises of 3 major modules with their sub-modules as follows:

Admin:

Login:

Admin can login using id and password.

Manage fuel Station:

Add/update/delete/view fuel Station.

Choose Station location from map

View Users:

View registered users

View Orders:

Admin can view all the orders.

Fuel Station:

Register:

Fuel station must be registered using it's details.

Login:

Station Manager can login using id and password.

Change Password:

Station Manager can change the password.

Manage Inventory:

Update inventory.

Orders:

Pending - New orders which must be accepted/Processed

Today's Orders - list of today's orders and update status

All Orders - list of all the orders with date selection

User:**Register:**

User can register using personal details.

Login:

User can login in his personal account using id and password.

Profile:

View and update

Change Password:

can change the password within app

Home:**fuel Station:**

current location by default or search by area
select gas type/quantity

Payment Module

Orders:

List of All the orders
Cancel if not processed

Notification:

Status updates of the orders
